A **schema** is a named collection of tables. A schema can also contain views, indexes, sequences, data types, operators, and functions. Schemas are analogous to directories at the operating system level, except that schemas cannot be nested. PostgreSQL statement CREATE SCHEMA creates a schema.

## Syntax

The basic syntax CREATE SCHEMA is as follows:

```
CREATE SCHEMA name;
```

Where *name* is the name of the schema.

## Syntax to Create table in Schema

The basic syntax to create table in schema is as follows:

```
CREATE TABLE myschema.mytable (  
    ...  
);
```

## Example

Let us see an example for creating a schema. Connect to the database *testdb* and create a schema *myschema* as follows:

```
testdb=# create schema myschema;  
CREATE SCHEMA
```

The message "CREATE SCHEMA" signifies that the schema is created successfully.

Now, let us create a table in the above schema as follows:

```
testdb=# create table myschema.company (  
    ID    INT            NOT NULL,  
    NAME  VARCHAR (20)    NOT NULL,  
    AGE   INT            NOT NULL,  
    ADDRESS CHAR (25) ,  
    SALARY DECIMAL (18, 2),  
    PRIMARY KEY (ID)  
);
```

This will create an empty table. You can verify the table created with the command below:

```
testdb=# select * from myschema.company;
```

This would produce the following result:

```
 id | name | age | address | salary  
----+-----+-----+-----+-----  
(0 rows)
```

## Syntax to Drop schema

To drop a schema if it's empty (all objects in it have been dropped), then use:

```
DROP SCHEMA myschema;
```

To drop a schema including all contained objects, use:

```
DROP SCHEMA myschema CASCADE;
```

## Advantages of using a Schema

- It allows many users to use one database without interfering with each other.
- It organizes database objects into logical groups to make them more manageable.
- Third-party applications can be put into separate schemas so they do not collide with the names of other objects.
